Crate erector machine

Our modular solutions can be used anywhere

With the Taks Handling Systems crate erector machine you choose savings in labour costs, more efficiency and top quality when working with folding crates. Our years of experience have enabled us to develop fully automatic modular solutions for packaging lines. This means that the crate erector machine is excellent either as a stand-alone device or when integrated into the processing line. All with a guaranteed long life span and low downtime.

Your total solution

The crate erector machine can be modified with options and customized solutions to meet specific circumstances or user requirements. With a wide range of options such as automatic feeding for multiple stacks, automatic stacking and removal we can offer a complete solution for the processing of folding crates for all your products.

The Taks crate erector machine takes work out of your hands and ensures continuity

Example of crate erector machine

Crate erector machine

Specially developed to reduce labour when working with folding crates. The stacks of folded crates are fed in from the pallet. The stack height on the pallet is 2300 mm. The integrated de-stacker feeds the crates into the machine individually. Unfolded crates are then transported from the machine to a desired location automatically. Suitable for any type of folding crate. Capacity of 750 crates per hour.

Expansion options

The crate erector machine can be expanded with the following options:

- **Automatic feeding of multiple stacks of folded crates to several pallets**
- **Automatic stacking of unfolded crates**
- **Automatic removal of unfolded crates to a desired location**
